ABOUT US

Bysanton Foreign Trade Inc. is the group company of Epsilon Corporate Solutions, Taşkın Marble and Laradekor brands, which has more than 30 years of construction site experience since 1990. Our group companies are proud to touch the quality of life of nearly 100,000 families with more than 5000 projects that they sell and implement. Funda is the patented brand of Bysanton Foreign Trade Inc. As of 2019, our journey to central vacuum system has started with the brand of Funda. Encouraged by the intense interest shown in our rapidly growing brand, a brand-new organizational structure was adopted in 2023.

MISSION

We aim to deliver our product, which has become easy to implement thanks to its ergonomic design, to wider audiences with the distribution network we have newly created. We aim to make our homes breathable without carrying a vacuum cleaner, with an environment where there is no noise and dust does not fly.

VISION

To become one of the leading companies of Turkey on a national scale. Our biggest goal is to contribute to the national income of our country by growing on a global scale.

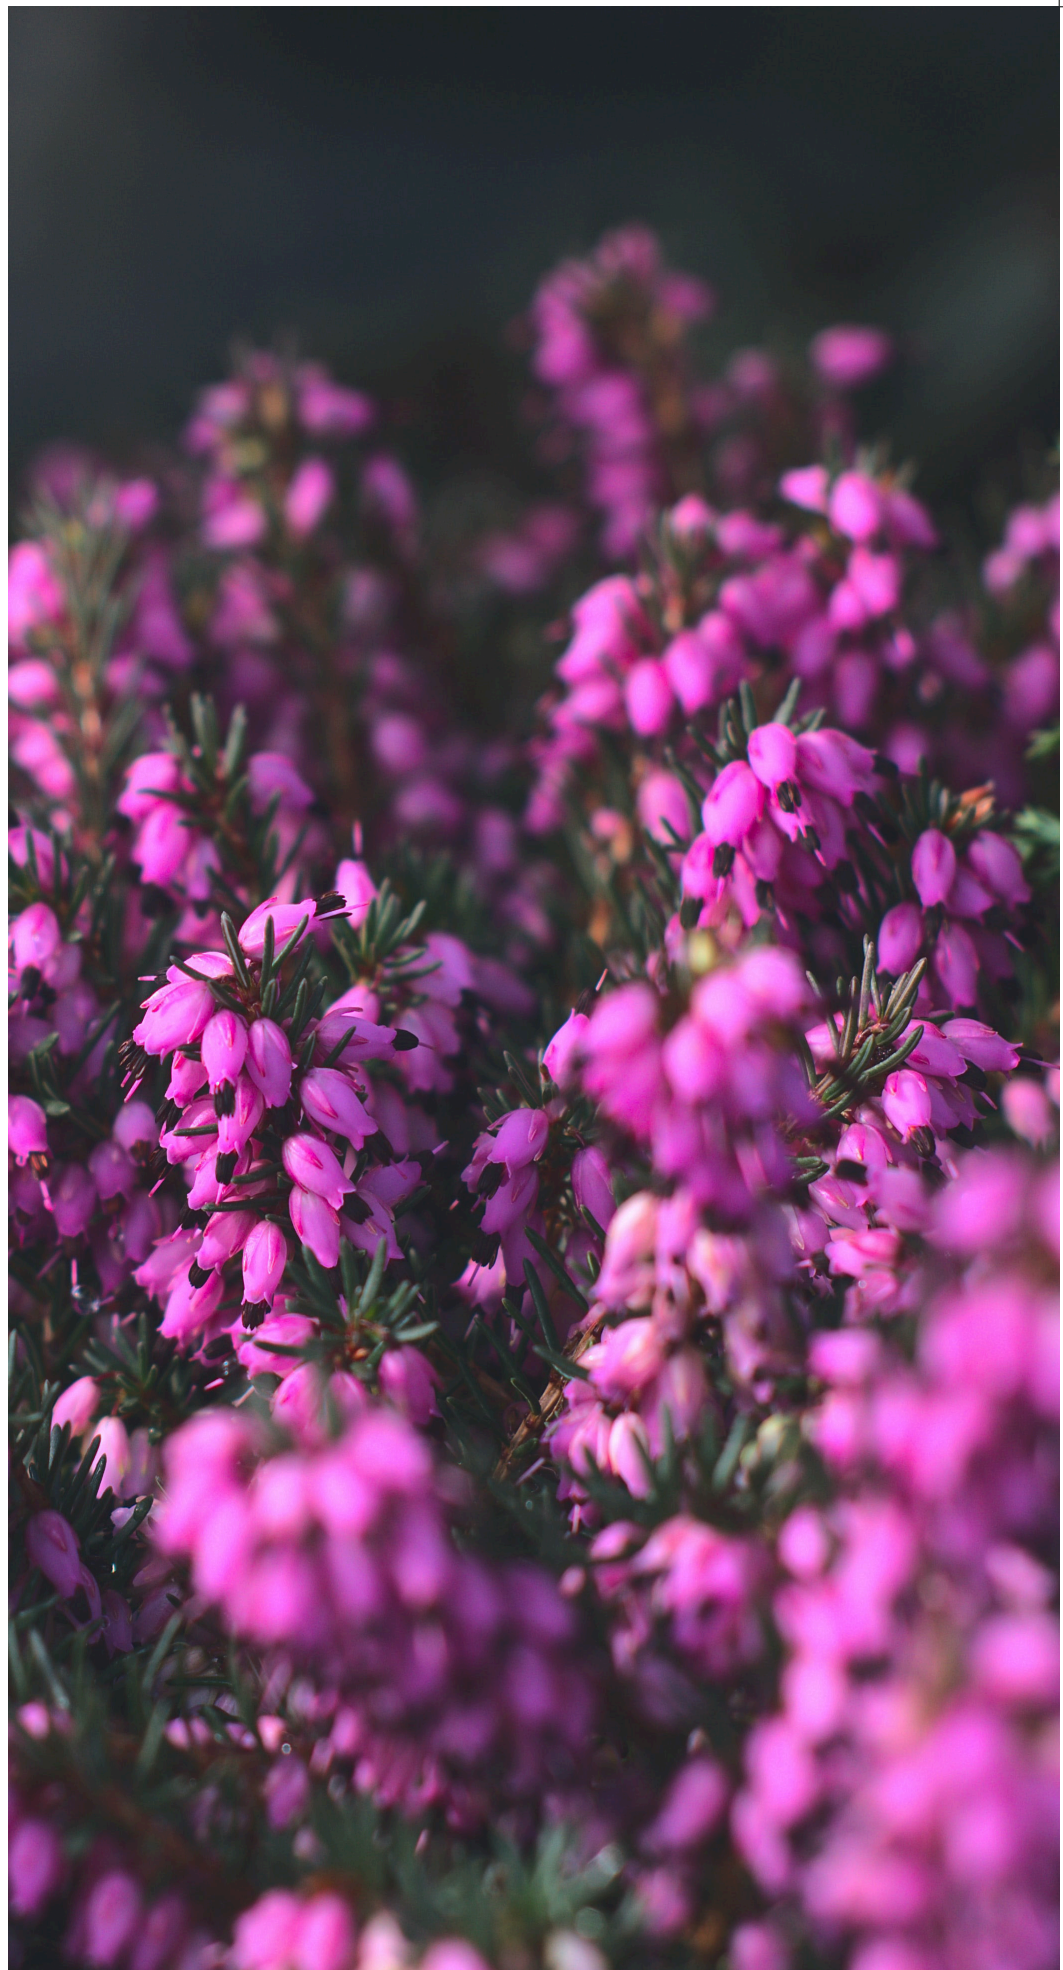

WHAT IS FUNDA FLOWER?

The heather flower, known as the broom plant, has been used for making brooms for years. It is also known to be a source of healing in the treatment of many diseases.

With the advancement of technology, vacuum cleaners have taken the place of brush brooms made from heather flowers today. Vacuum cleaners have a negative impact on human health because they spray out the dust and some of the bacteria they trap. This fact is so important that a wet model vacuum cleaner is also produced to trap dust. These products, which are difficult and heavy to use, are now being replaced by **FUNDA Central Vacuum Cleaner Systems.**

Funda Central Vacuum Cleaner Systems brings a new breath to the vacuum cleaner technology. In addition to making your home cleaning the most comfortable, it also thinks about your health.

No more flying dust that impairs your air quality, dusting after sweeping, noise pollution and lower back pain.

HISTORY OF VACUUM CLEANER

In the 18th century, carpets and furniture were beaten with sticks and cleaned by washing. Cleaning in this way was quite difficult. The first vacuum cleaner was a commercial dust removal machine, which was exhibited at a fair in London in 1898. The machine was collecting the dust blown by the air it blew in the metal box above it.

Over time, a new machine was developed that sucked and filtered the dust. Bellows cleaners with rotating brushes and absorbing dirt were used (1871). This device runs on fuel and was quite difficult to carry. It could be transported by horse carriages. Thanks to the hoses extended from the windows, the mansions of the rich were being cleaned. This invention was very successful.

He did a lot of work, first the UK Palaces, then the European Palaces, the palaces of the dukes, and the castles.

It developed over time and became smaller enough to fit in small pickup trucks. Entrepreneurs took the step in 1910, succeeding in bringing these gigantic brooms from palaces and mansions to petty-bourgeois homes. A lightweight, handheld vacuum cleaner was created.

Meanwhile, practical vacuums were developed by an entrepreneur who is allergic to dust. These brooms, which are called "Girgir" among the people in our country, became widespread in a short time as there was no electricity problem.

However, when vacuum cleaners developed and became cheaper, they lost their value. Today, small palm models are produced and still used because they are practical and dust-free.

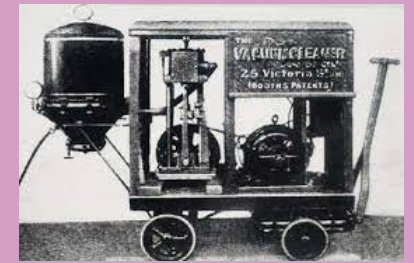

At the point where the vacuum cleaner, which started its development by removing dust, has reached today, "dust" plays the leading role again.

Some of the machines used today, after throwing the dust into the chamber, give out the air they take without filtering, and they do not take the invisible parts such as cigarette ash, animal excrement residues, pollen.

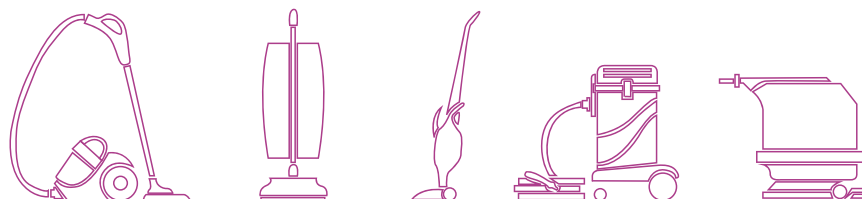

In both cases, the risk of asthma or allergic disease may occur. Invisible creatures called mites are the leading cause of asthma and allergies.

When we want to sweep the house and keep it clean, we can make ourselves sick. That's why you should pay attention to the fact that it is dust-free when buying a vacuum cleaner. Especially when we have little puppies at home.

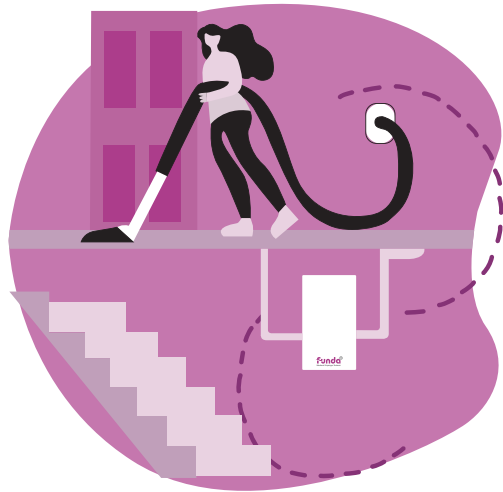

At the last point of technology, Central vacuum cleaner systems are widely used. In fact, when you look at it, it seems to be inspired by the vacuums used in the 1800s as a working logic.

NEGATIVE EFFECTS OF VACUUM CLEANER ON HUMAN HEALTH & ADVANTAGES OF VACUUM CLEANER

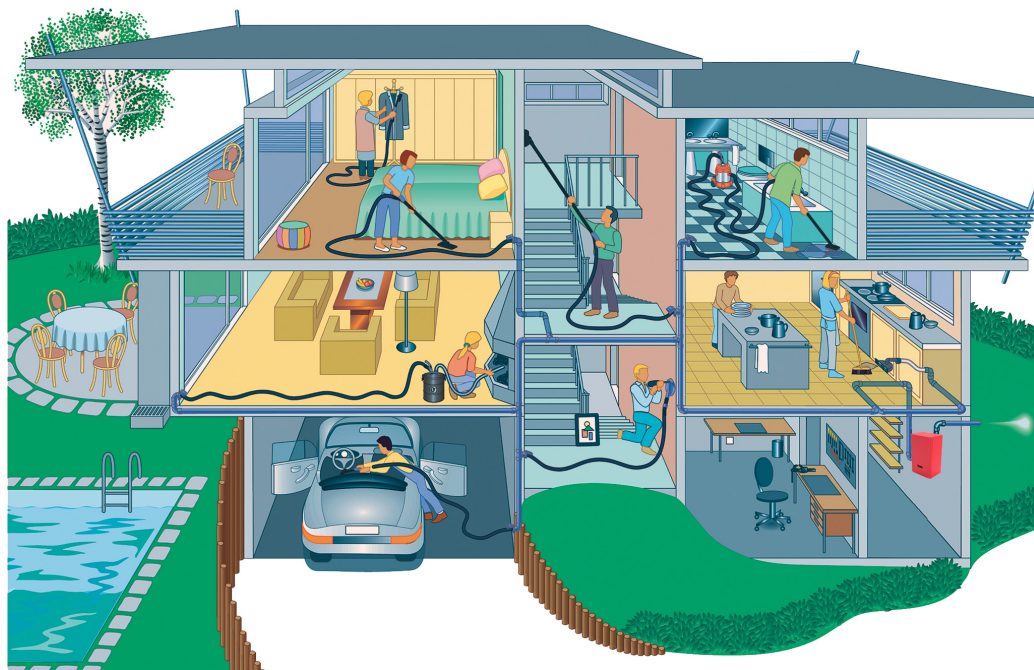

Vacuum cleaners make a noise of 85 decibels, which is above the normal hearing level. Since the used vacuum cleaner motor will be outside your living space, you will not be affected by the noise in any way.

Vacuum cleaners have powerful motors. Therefore, it wears out early. As a result of wear, the parts that prevent dust leakage are weakened and it sprays out some of the dust that needs to be trapped. This adversely affects human health. Since the dust bag is not inside your house, you will be away from bad smell and humidity.

It has a very high suction power and does not spray the dust and bacteria it absorbs into the same environment. It traps it inside. Even if there is a malfunction, you will not be affected by the negativities since you are not in the same environment as the engine.

HIDDEN HOSE SYSTEM

The perfect solution for easy and efficient cleaning

Hidden hose system is the vacuum hose that is pulled back to the wall sockets by the suction power of your machine. There is a retractable hose system.

Practical

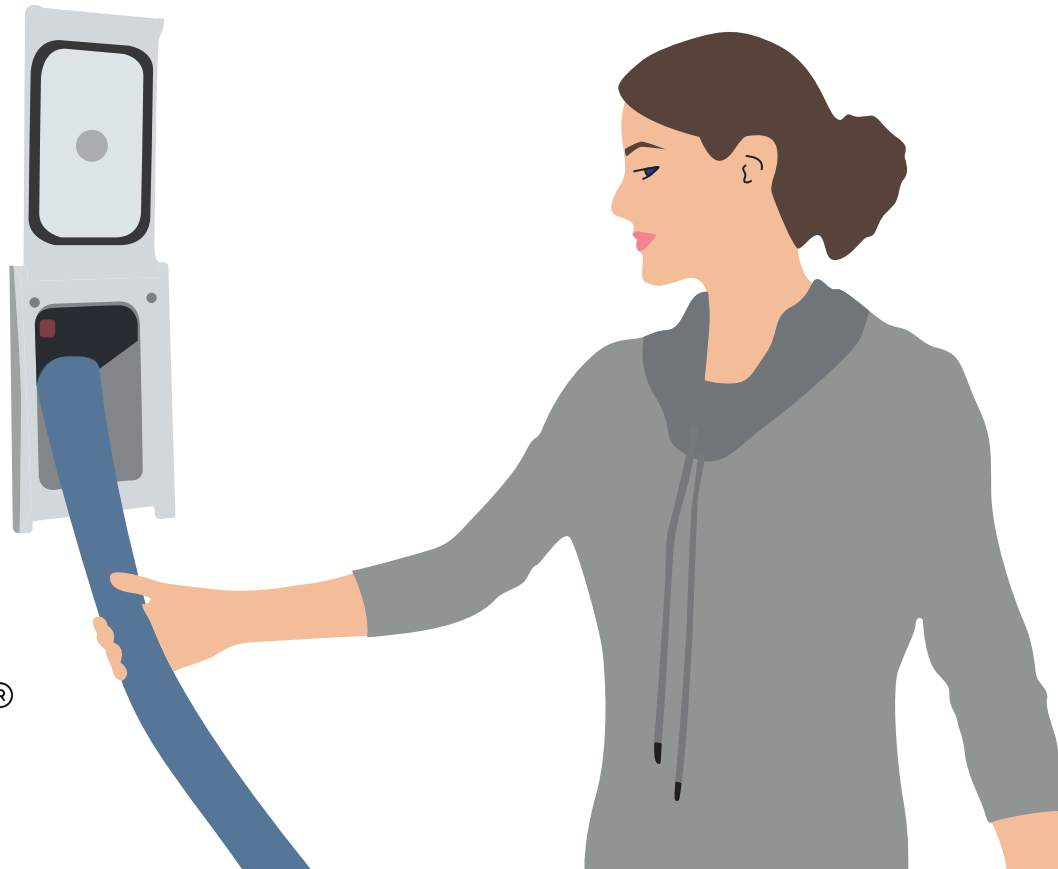

There is no need for a storage area for the hose. There are hoses right behind the sockets on the walls.

Easy

Behind each outlet is a hose. In this way, the broom is always at hand. You can quickly clean the dry dirt that occurs easily.

Dynamic

There is no hose you have to carry around the house. The hidden hose system is more convenient than a conventional vacuum cleaner for quick and practical cleaning. Unplug the hose of the length you need, store the hose in the socket again after cleaning.

PORTABLE HOSE SYSTEMS

Practical solution for easy and efficient cleaning

As the name suggests, the portable hose system is a system that works with hoses attached to the sockets on the walls from the outside. It provides quiet and dust-free cleaning with high suction power.

The difference from the hidden hose system is that it is economical and the hose is kept outside. In the hidden hose system, each socket has its own hose inside. In the portable hose system, there is a single hose outside. Thanks to its socket, whichever socket will be cleaned, the socket is plugged there and the sweeping operation is performed.

Hose lengths have different lengths such as 8, 10 and 12 meters. After the cleaning process is completed, the hose is collected and attached to its hanger. There is no change in engine and suction power in both systems.

IMPLEMENTABLE PLACES

Apartment

Yacht

Laboratory

Villa

Complex

Administration Building

Hotel

Mosque

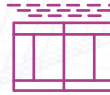

Beauty Salon

Restaurant

Dormitory

Gym

Cinema

Nursing Home

Garage

Kindergarten

Hospital

Public Institution

RECOMMENDED INSTALLATION LOCATIONS

It does not take up space neither cause visual pollution.

Funda Central Vacuum System does not cause visual pollution thanks to its different mounting applications, but rather looks like a decorative product. It certainly will not bother you.

The garbage bag and filter can be easily changed and cleaned thanks to the easy-to-use cover feature. Thanks to this feature, less service need arises.
